

Serial No.: 10/674,119

IN THE CLAIMS:

Please amend the claims as follows:

1. (Currently Amended) Driver circuit for driving a useful signal having:
  - (a) at least one amplifier circuit with low output impedance for the signal amplification of the useful signal;
  - (b) a protection impedance respectively connected downstream of the amplifier circuit and serving to protect the amplifier circuit;  
wherein
  - (c) provision is respectively made of a feedback circuit for the frequency-dependent signal feedback of the useful signal amplified by the amplifier circuit; wherein
  - (d) the signal feedback circuit respectively has a capacitor, which is connected between the signal output of the operational amplifier and a signal input of the operational amplifier, and a resistor, which is connected between the signal line connection and the signal input of the operational amplifier.
2. (Previously Presented) Driver circuit according to Claim 1, wherein the amplifier circuit is an operational amplifier having an inverting signal input, a noninverting signal input and a signal output.
3. (Previously Presented) Driver circuit according to Claim 1, wherein the protection impedance is connected between the signal output of the operational amplifier and a signal line connection for the connection of a signal line.
4. (Previously Presented) Driver circuit according to Claim 3, wherein the signal line is a telephone line for connecting a telephone to the driver circuit.

Serial No.: 10/674,119

5. (Previously Presented) Driver circuit according to Claim 1, wherein the driver circuit is of differential construction and has two symmetrically constructed amplifier circuits, two symmetrical protection impedances and two symmetrically constructed feedback circuits.
6. (Canceled)
7. (Previously Presented) Driver circuit according to Claim 1, wherein the signal feedback circuit feeds back high-frequency signal components of the useful signal amplified by the amplifier circuit to the signal input of the amplifier circuit to a greater extent than low-frequency signal components of the useful signal amplified by the amplifier circuit, so that the output impedance of the driver circuit is reduced in a specific first frequency range up to a first limiting frequency which lies above the second limiting frequency of the useful signal.
8. (Previously Presented) Driver circuit according to Claim 7, wherein the first frequency range comprises of a second frequency range provided for the transmission of the useful signal.
9. (Previously Presented) Driver circuit according to Claim 8, wherein the second frequency range is a voice signal band for the transmission of a telephone voice signal.
10. (Previously Presented) Driver circuit according to Claim 9, wherein the second limiting frequency of the second frequency range is about 4 kHz.
